Overview

Docker is an open source application container engine that allows developers to package their applications and dependencies into a portable image that can then be distributed to any popular Linux , Windows or macOS machine, as well as virtualization. Containers are completely sandboxed and have no interface with each other.

Start the container by running images. An image is an executable package that contains everything you need to run the application - code, runtime, libraries, environment variables, and configuration files.

Containers are examples of images runtime - while being executed (that is, images state, or user process) in memory, you can use commands to view a list of docker ps that are running containers, just as in Linux.

Docker is now very important in the cloud and edge computing, through Docker images and containers, user can deploy KernSafe iSCSI SAN service very easily, by leveraging Docker technology, users can very quickly to provide iSCSI service from Windows, Linux or macOS server.

The document provides step-by-step guide for user to deploy iSCSI service through Docker container.

Deploy SuperSAN Docker Image

We have created an existing Docker image where the KernSafe iSCSI SAN server has been pre-installed. User can use the image to quickly deploy iSCSI SAN in 1 minute. Or user can create their own defined Docker image.

Pull the existing SuperSAN Docker Image

In the Docker host machine, issue the following command to pull the existing Docker image:

```
#docker pull kernsafe/supersan
```

After downloading completed, issue the command to see if the image placed there:

```
#docker images
```

```
[root@localhost ~]# docker images
REPOSITORY          TAG                 IMAGE ID            CREATED             SIZE
[root@localhost ~]# docker pull kernsafe/supersan
Using default tag: latest
Trying to pull repository docker.io/kernsafe/supersan ...
latest: Pulling from docker.io/kernsafe/supersan
f34b00c7da20: Pull complete
2ad0958a073d: Pull complete
45c293c87634: Pull complete
Digest: sha256:766f5069a03c63b9ab75a831886fa9cbfbeb00b26f6e6f891da29da0c47c0457
Status: Downloaded newer image for docker.io/kernsafe/supersan:latest
[root@localhost ~]# docker images
REPOSITORY          TAG                 IMAGE ID            CREATED             SIZE
docker.io/kernsafe/supersan  latest             9311d52975e6       6 weeks ago        572 MB
[root@localhost ~]#
```

Install SuperSAN into new Docker Image

User can install SuperSAN into any Linux based container, there is no difference between installing into Linux physical machine and container, please refer to the white paper to install KernSafe iSCSI SAN into Docker container.

<https://www.kernsafe.com/tech/supersan/install-and-using-kernsafe-iscsi-san-on-linux.pdf>

Of choosing the OS, CentOS 7.x and Ubuntu Server 20+ are recommended.

Prepare Datastore

User can use a local storage in the Docker host machine, could be a local HDD/SSD/NVMe, using mkfs to format a suitable filesystem and then mount to a folder, like:

```
#mkfs.ext4 /dev/nvme0n1
#mkdir /mnt/iscsi
#mount /dev/nvme0n1 /mnt/iscsi
```

Launch the Docker container

User can issue the following command to start a container, as the SuperSAN need "init" process, user should start the init process.

```
# docker run -tid --privileged=true -p 192.168.80.21:3260:3260 -p 192.168.80.21:3268:3268 -p
192.168.80.21:3261:3261 -v /mnt/iscsi:/iscsi 9311d52975e6 /sbin/init
```

We need -p to specify port forwarding from the container to the host, specify IP address to let Docker to select which network to offer iSCSI SAN service, we need to open the following ports:

3260, iSCSI service.

3261, iSCSI management console port.

3268, iSCSI Web based management console port (optional).

Use -v to passthrough host datastore path into the Docker container.

9311d52975e6 is the image id, use need to replace one that shown in the docker images command.

Then issue the command to enter the new created container:

```
#docker ps
#docker exec -it 6df08fc706d4 /bin/bash
```

6df08fc706d4 is the Docker container ID, user need to replace it as shown in the “docker ps” command.

In the docker container, issue the command to see if KernSafe iSCSI SAN service is running well:

```
[root@6df08fc706d4 /]# service supersand status
● supersand.service - LSB: supersan
   Loaded: loaded (/etc/rc.d/init.d/supersand; bad; vendor preset: disabled)
   Active: active (running) since Tue 2021-10-19 06:31:31 UTC; 1min 23s ago
     Docs: man:systemd-sysv-generator(8)
  Process: 408 ExecStart=/etc/rc.d/init.d/supersand start (code=exited, status=0/SUCCESS)
   CGroup: /system.slice/docker-6df08fc706d4d212c1c2201a85634c7147a687db16c8ee7e0a1d70a483848b14.scope/system.slice/supersand.service
           └─412 /opt/SuperSAN/supersan

Oct 19 06:31:28 6df08fc706d4 systemd[1]: Starting LSB: supersan...
Oct 19 06:31:29 6df08fc706d4 supersand[408]: Starting KernSafe SuperSANpid: 411, hpage size: 2097152
Oct 19 06:31:31 6df08fc706d4 systemd[1]: Started LSB: supersan.
[root@6df08fc706d4 /]# █
```

Set up High Availability iSCSI SAN

HA iSCSI SAN is important service for providing Uninterrupted service. User can skip this step if user do not need to create HA iSCSI SAN service.

Launch the Docker container

Now we use 192.168.0.101, 192.168.0.102 as the storage network IP, please see above topics for details.

Launch the first Docker container.

```
# docker run -tid --privileged=true -p 192.168.0.101:3260:3260 -p 192.168.0.101:3268:3268 -p
192.168.0.101:3261:3261 -v /mnt/iscsi:/iscsi 9311d52975e6 /sbin/init
```

Enter into the first container, this step is optional.

```
#docker ps
```

```
#docker exec -it 6df08fc706d4 /bin/bash
```

Launch the second Docker container (should be on another host).

```
# docker run -tid --privileged=true -p 192.168.0.102:3260:3260 -p 192.168.0.102:3268:3268 -p
192.168.0.101:3261:3261 -v /mnt/iscsi:/iscsi 9311d52975e6 /sbin/init
```

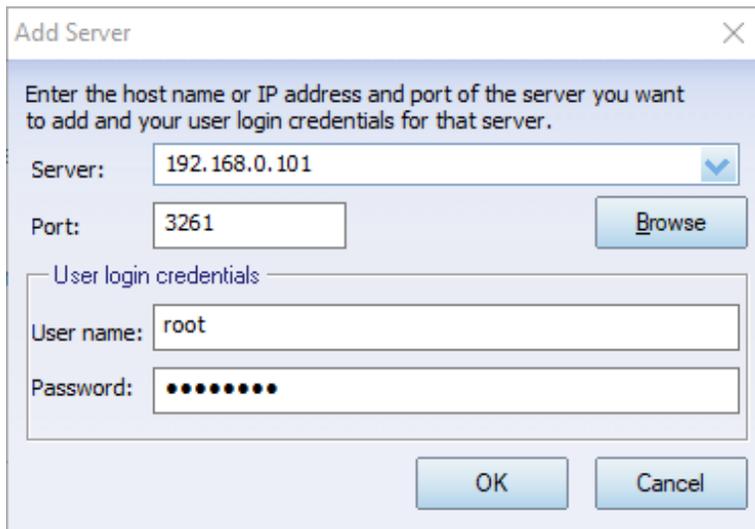

Enter into the first container, this step is optional.

```
#docker ps
```

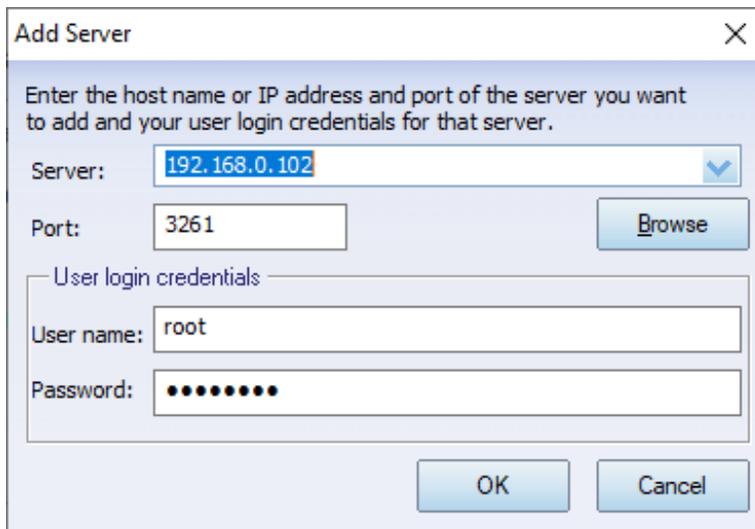

```
#docker exec -it 6df08fc706d4 /bin/bash
```

Configuring in the Management Console

Open **KernSafe iSCSI SAN Management Console**. Click Server->Add Another Server.

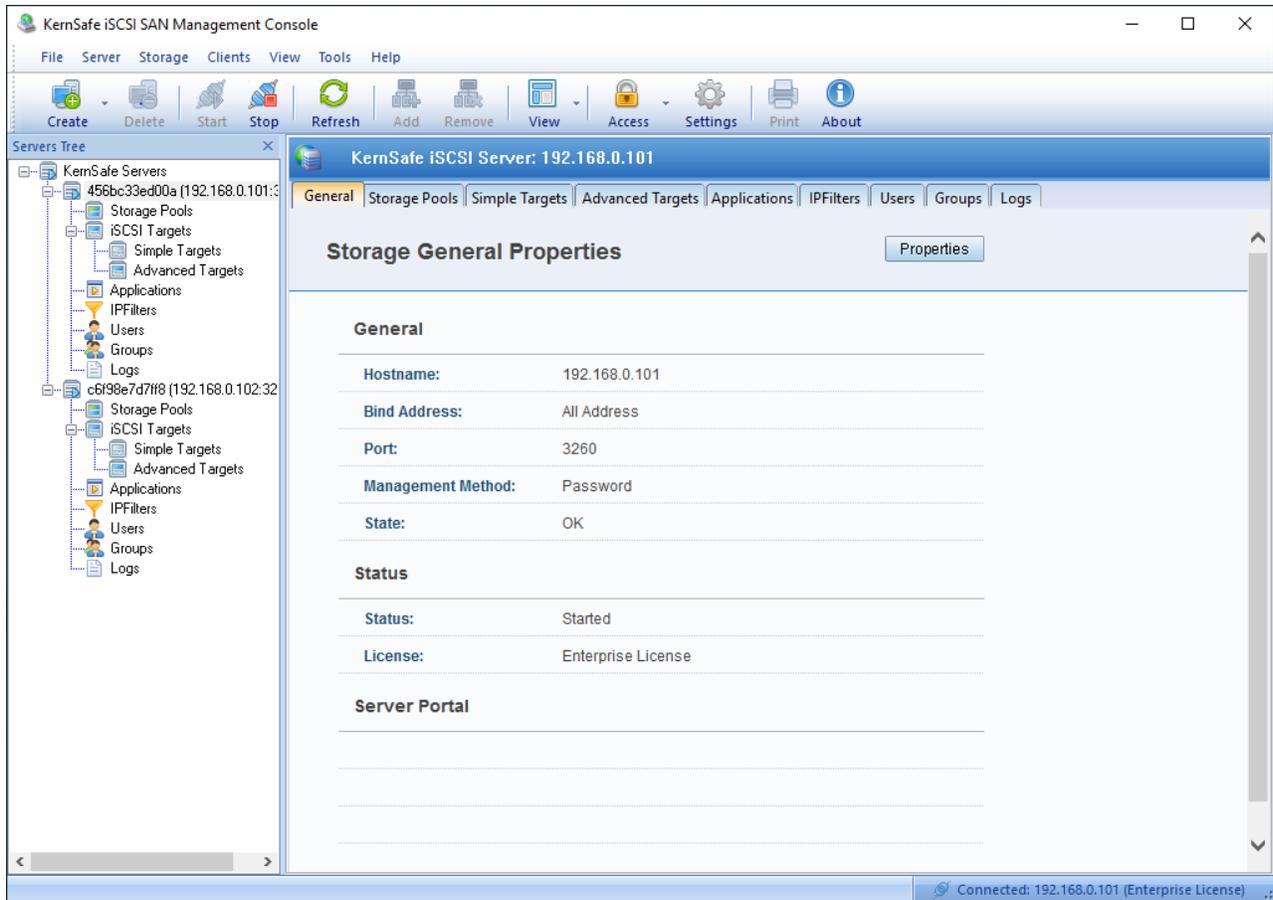

The screenshot shows a dialog box titled "Add Server" with a close button (X) in the top right corner. The main text reads: "Enter the host name or IP address and port of the server you want to add and your user login credentials for that server." Below this, there are three input fields: "Server:" with the value "192.168.0.101" and a dropdown arrow; "Port:" with the value "3261" and a "Browse" button; and "User login credentials" which includes "User name:" with the value "root" and "Password:" with a masked field of eight dots. At the bottom, there are "OK" and "Cancel" buttons.

The screenshot shows a second instance of the "Add Server" dialog box. The "Server:" field now contains "192.168.0.102", which is highlighted with a blue selection box. All other fields, including the port "3261", user name "root", and masked password, remain the same as in the first screenshot. The "OK" and "Cancel" buttons are also present at the bottom.

Type the two IP address on each Add Server dialog, and then press the OK button.

The main interface is shown as this.

Acquire and install license keys

Users need license key for each KernSafe iSCSI SAN instance, a trial license key will be automatically acquired through internet when first run, if the progress failed, user may ask us to obtain a trial or free license key or purchase commercial license keys.

Select each server node and click on the menu item Help->Apply License, then the Apply License Wizard shows.

Apply License Wizard

Choose License Type
Select which type of license key you want to apply.

- Free License**
Apply a free license key.
- Commercial License**
Apply a commercial license key.
- Site License**
Apply a VLK, OEM or other site license key.
- Manual Activate**
Manual Activate the software by phone or email.
- Remove License**
Remove current license and change to trial mode.

< Back Next > Cancel

Select the license type and fulfilled the form and then press the Finish button, then user will see license information in the abort box or current server's generic information page.

Create Target on the first server

Select on the first server node, and press the **Create** button on the toolbar of KernSafe iSCSI SAN management console, the **Create Device Wizard** is shown.

Select a device type

Create iSCSI Target Wizard ✕

iSCSI Device Type 

Select which device type of the iSCSI target you want to create.

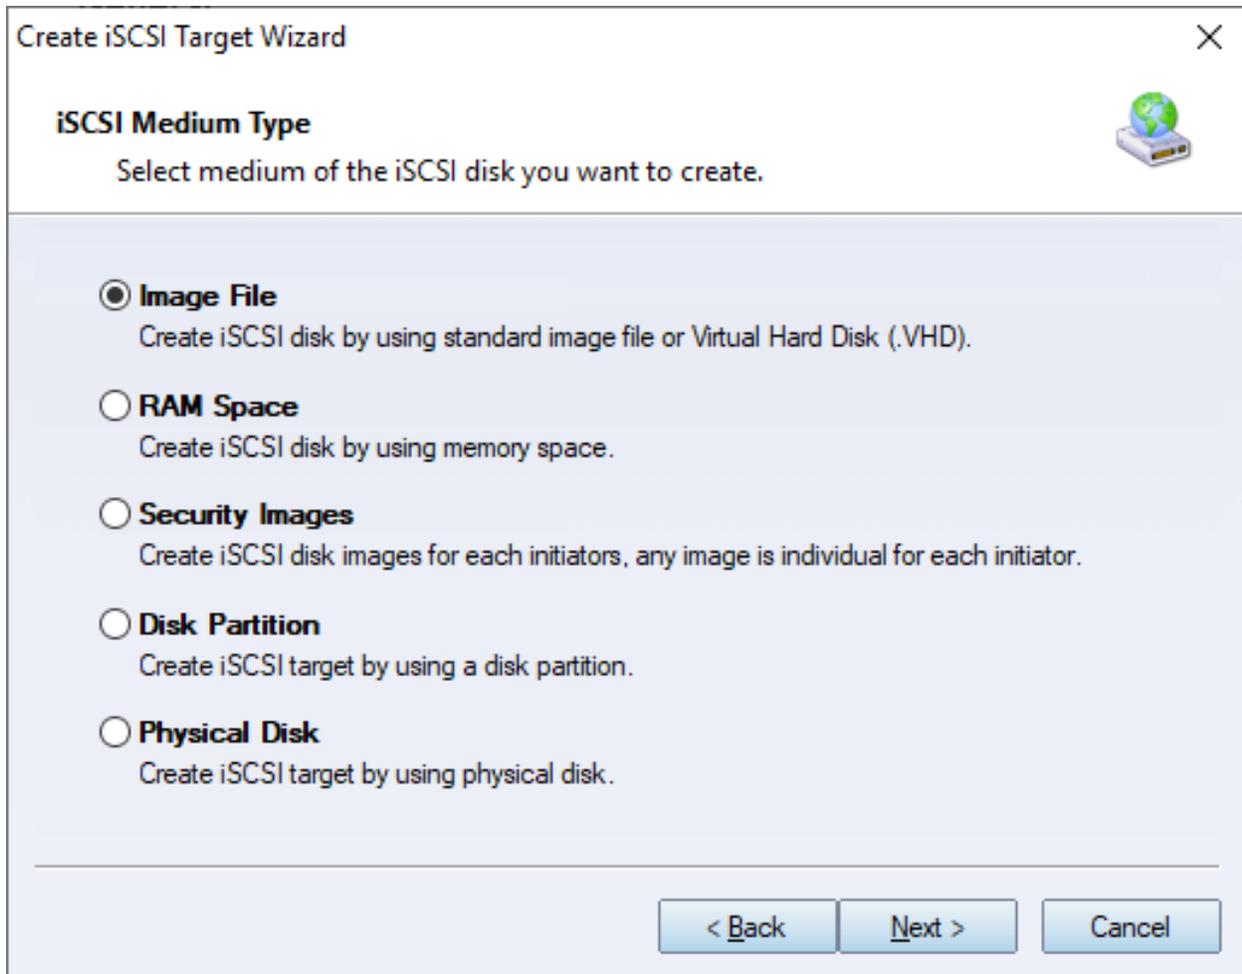

- Hard Disk**
Create iSCSI target by using physical disk, partition, standard image file or VHD.
- Optical Device**
Create iSCSI target by using physical optical drive or CD / DVD image file.
- Advanced Device**
Create advanced iSCSI target such as CDP device and snapshot linked device.
- Storage Volume**
Create iSCSI target from storage pool.

< Back Next > Cancel

Choose **Hard Disk**.

Press the **Next** button to continue.

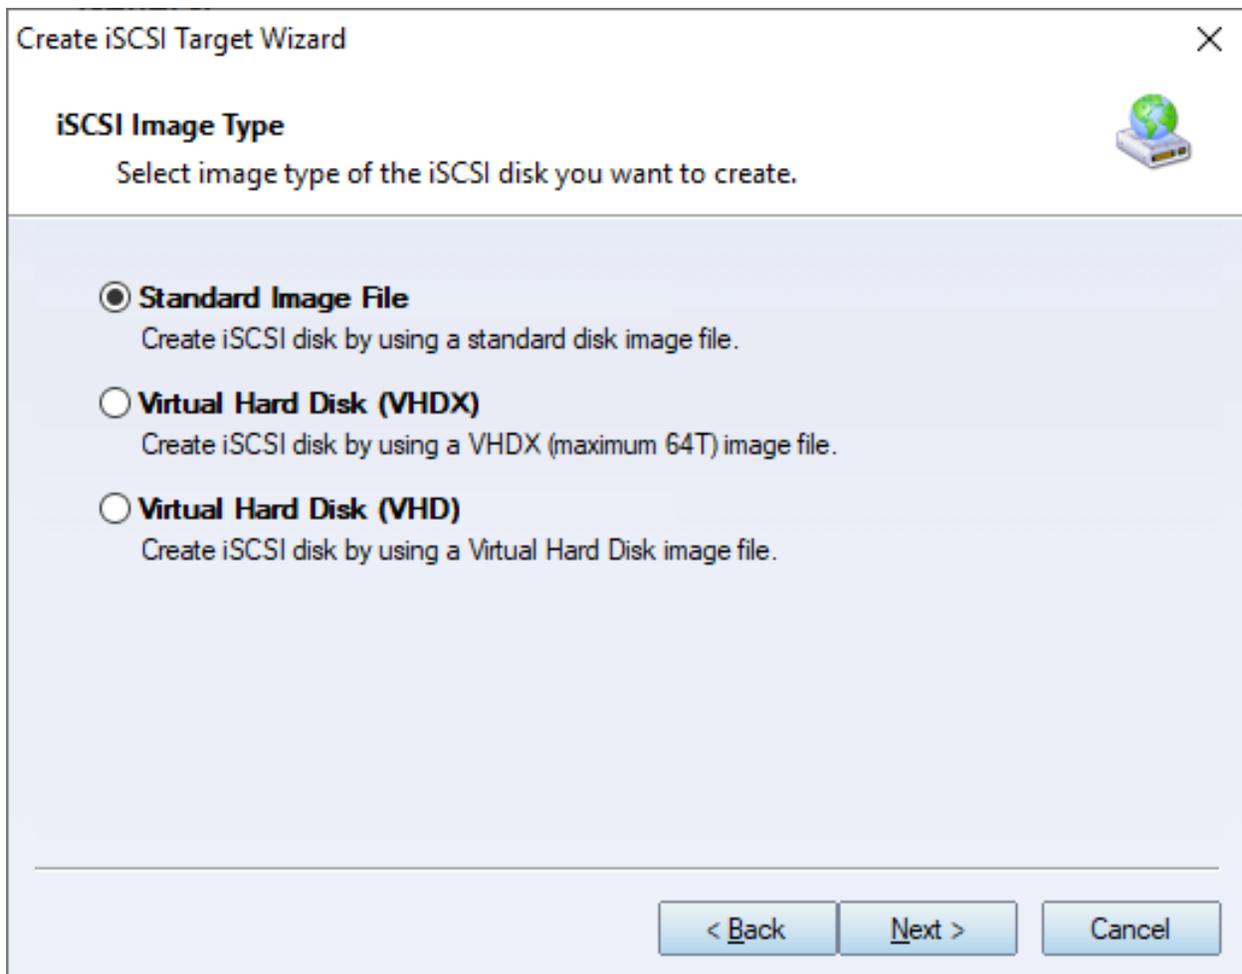

Select a medium type.

Choose **Image File** in **iSCSI Medium Type** window.

Then press **Next** button to continue.

Select an Image type.

Choose **Standard Image File**.

Press the **Next** button to continue.

Specify image file path and size.

Create iSCSI Target Wizard

Virtual Image Disk Configuration

Specify a image file full path and parameters.

Image file parameters

Create a new image file Use existing image file

Full path and name of the image file:

Device Size in MBs:

Fill with zeros Enable windows cache

File system options

Sparse file (Recommended for image files smaller then 1TB)

Compressed (Enable file system compress feature)

Encrypted (Enable NTFS encryption feature)

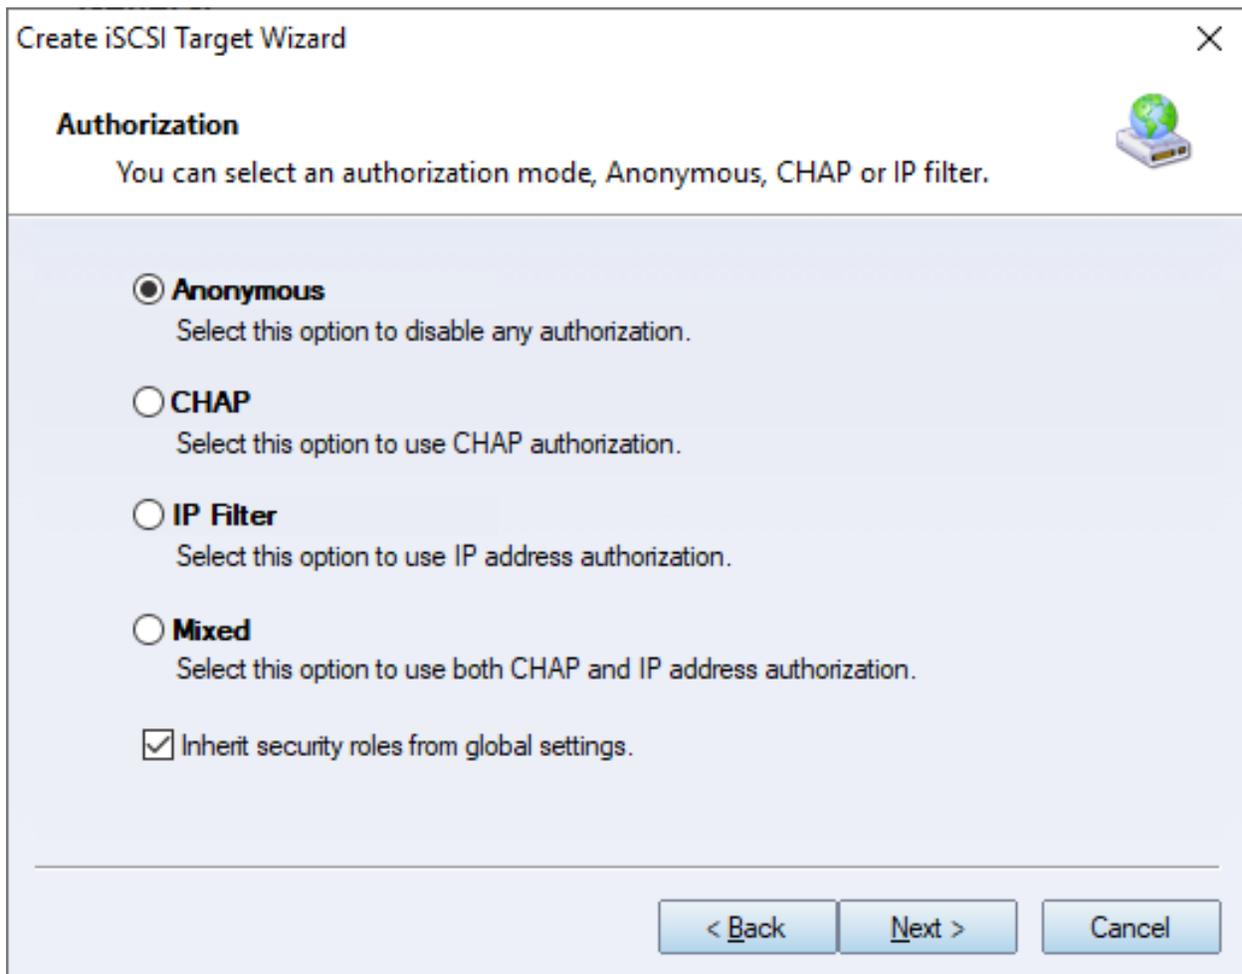

Specify the image file.

Specify the device size.

If you check **Use sparse file on NTFS file system**, the size of disk image file only depends on its content used, it can save your hard disk space.

Press the **Next** button to continue.

Set authorization mode.

The screenshot shows a Windows-style dialog box titled "Create iSCSI Target Wizard" with a close button (X) in the top right corner. The main heading is "Authorization" in bold, followed by the instruction: "You can select an authorization mode, Anonymous, CHAP or IP filter." To the right of this text is a small icon of a globe on a server base. Below the instruction are four radio button options: "Anonymous" (selected), "CHAP", "IP Filter", and "Mixed". Each option has a short description. At the bottom left, there is a checked checkbox labeled "Inherit security roles from global settings." At the bottom right, there are three buttons: "< Back", "Next >", and "Cancel".

Create iSCSI Target Wizard [X]

Authorization [Globe Icon]

You can select an authorization mode, **Anonymous**, **CHAP** or **IP filter**.

- Anonymous**
Select this option to disable any authorization.
- CHAP**
Select this option to use CHAP authorization.
- IP Filter**
Select this option to use IP address authorization.
- Mixed**
Select this option to use both CHAP and IP address authorization.

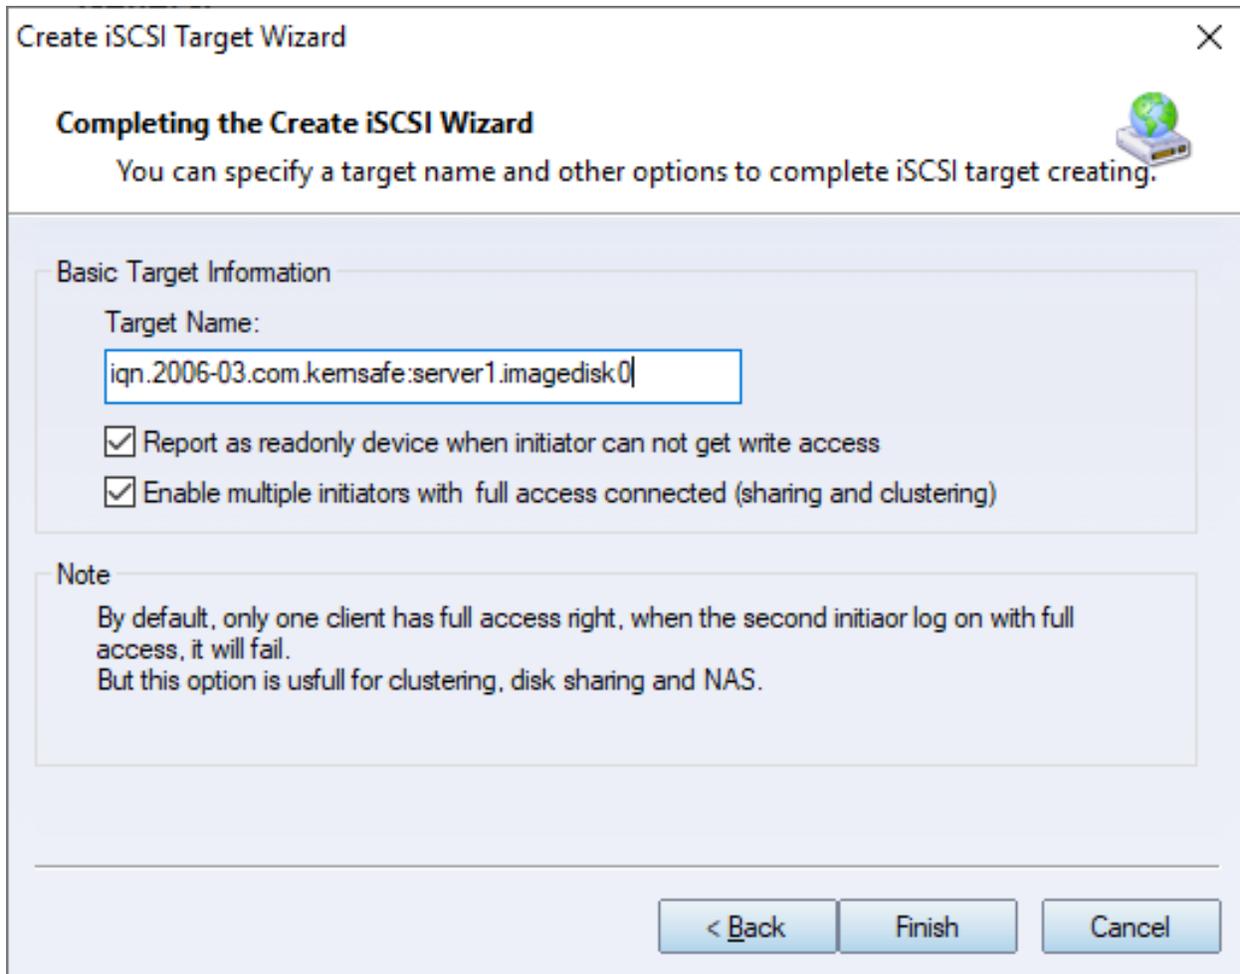

Inherit security roles from global settings.

[< Back] [Next >] [Cancel]

Choose **Anonymous** authorization.

Press the **Next** button to continue.

Finish creating iSCSI Target

Type a target name in the Target Name field, we use **server1.imagedisk0** as an example.

Check the **Enable multiple initiators with full access connected (sharing and clustering)** check box.

Press the **Finish** button to complete create target.

Create Target on the second server

Select on the second server node in the KernSafe iSCSI SAN management console, and then repeat the above steps to create the second target as the name server2.imagedisk0.

Creating Application on server1

Select on the first server, right click **Applications** on the left tree of the main interface, choose **Create Application** on the pop-up menu, the **Create Application Wizard** widow will be shown.

Create Application Wizard [X]

Application Type
Select which type application that you want to create.

- Synchronous Replication**
Create real-time remote synchronous replication to iSCSI target or image file.
- Asynchronous Replication**
Create real-time remote asynchronous replication to iSCSI target or image file.
- High Availability Node**
Create a high-availability iSCSI SAN node or synchronizing with other iSCSI targets.

< Back Next > Cancel

Choose **High Availability Node**.

Then press **Next** to continue.

Create Application Wizard ✕

Failover Configuration 

You can specify two servers to fail over each other.

Base Target

Target Name	Device Type	
<input checked="" type="checkbox"/> iqn.2006-03.com.kemsafe:server1.imagedisk0	Disk	

Partner Target

Setting

< Back Next > Cancel

Check to select the existing target storage and click **Edit** to find the remote HA target.

Select iSCSI Target

iSCSI Source

Host Name: 192.168.0.102 Port: 3260

CHAP

Use CHAP to logon

User Name:

Secret:

Target

Target: iqn.2006-03.com.kemsafe:server2.imagedisk0

Discovery OK Cancel

Input the IP and port of server2 in **iSCSI Source** tab, and then click **Discovery** on the bottom of the window to find the mirror target, choose the new created target in the down-list.

Press **OK** button to continue.

Note: If the target needs CHAP authorization, you should provide user name and secret to logon.

Create Application Wizard ✕

Failover Configuration 

You can specify two servers to fail over each other.

Base Target

Target Name	Device Type	
<input checked="" type="checkbox"/> iqn.2006-03.com.kemsafe:server1.imagedisk0	Disk	

Partner Target

The mirror target will be added to the window, then click **Next** button to continue.

Create Application Wizard ✕

Synchronization Settings 

You can specify parameters for synchronization.

Sync

Local Address: Local Port:

Remote Address: Remote Port:

Alternative Sync 1

Local Address: Local Port:

Remote Address: Remote Port:

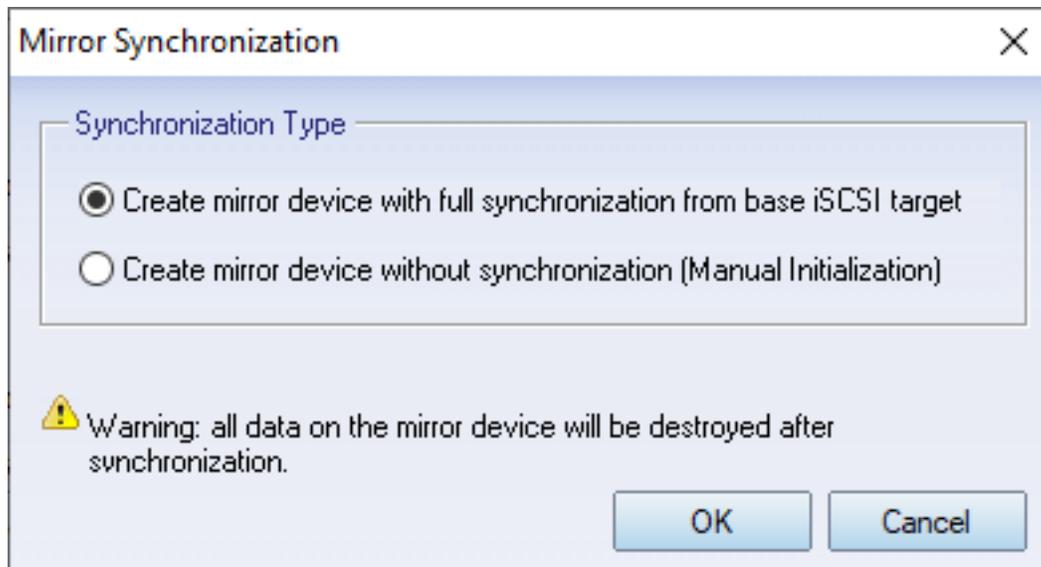

Alternative Sync 2

Specify a folder to save temporary data dump (folder must exist):

Specify local interface, port for Sybc interface and Heartbeat interface, if you have two NIC for each server ,you can sepcify different address-pair for Sync interface and Heartbeat interface, if you have only one NIC for synchronous, you can use same address for Sync and Heartbeat.

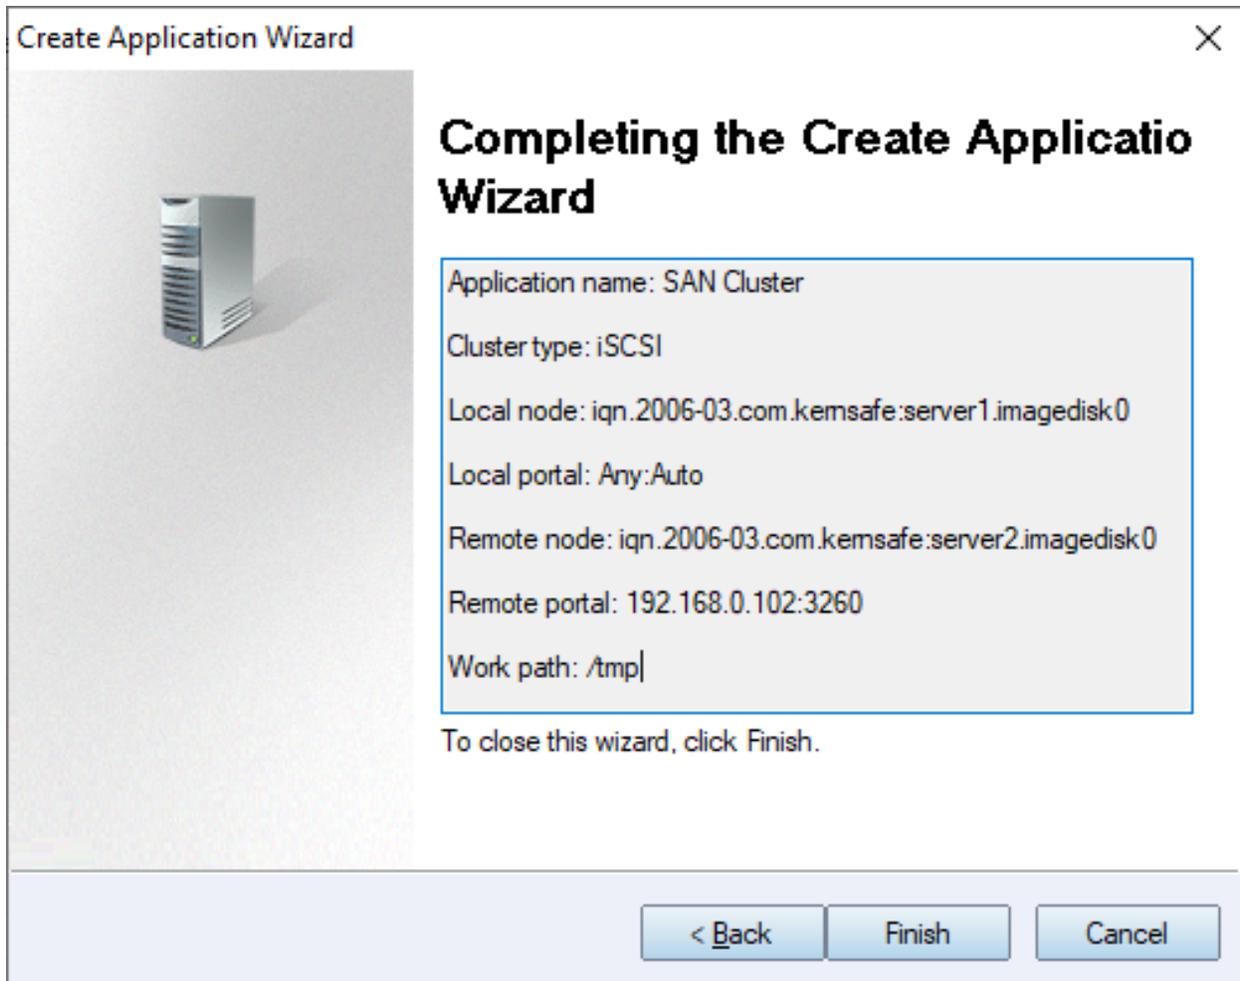

Specify the portal and port.

Press **Next** to continue

Now, the mirror target should be synchronized to the base target, if the two targets are both the new one and do not be initialized, we can choose **Create mirror device without synchronization (Manual Initialization)**, otherwise, we must choose **Create mirror device with full synchronization from base iSCSI target**.

Press **OK** button to continue.

Click **Finish** button to complete the application creation.

Creating Application on server2

Select on the second server, right click **Applications** on the left tree of the main interface, choose **Create Application** on the pop-up menu, repeat the above steps to create the second HA iSCSI SAN application that pointing to the target in the first server.

Then application server (client machine like Windows Server, Linux, ESX/ESXi, XenServer etc.) may use the two iSCSI targets for HA iSCSI device.
